

Python Programming - Basic Q&A;

Test document for PDF extraction, chunking, semantic retrieval, and grounded RAG question answering.

Q1. What is Python?

Answer: Python is a high-level, interpreted, general-purpose programming language known for readable syntax and a large standard library.

Q2. What is a variable in Python?

Answer: A variable is a name that refers to a value or object. Python does not require an explicit type declaration for variables.

Q3. What is a list in Python?

Answer: A list is an ordered, mutable collection that can contain multiple values. Example: numbers = [10, 20, 30].

Q4. What is a tuple?

Answer: A tuple is an ordered collection that is generally immutable after creation. Example: point = (10, 20).

Q5. What is a dictionary?

Answer: A dictionary stores data as key-value pairs. Example: student = {'name': 'Arun', 'age': 21}.

Q6. What is a function?

Answer: A function is a reusable block of code designed to perform a particular task. It is defined using the def keyword.

Q7. What is indentation in Python?

Answer: Indentation is whitespace used to define blocks of code in Python.

Q8. What is a class?

Answer: A class is a blueprint for creating objects. It can define attributes and methods.

Q9. What is inheritance?

Answer: Inheritance allows a class to derive attributes and methods from another class, supporting code reuse.

Q10. What is an exception?

Answer: An exception is an event that disrupts normal program execution. Python can handle exceptions using try and except.
